

## Static Conductive Belts

Under certain conditions of temperature and humidity, a belt drive may generate static electricity. Belts intended for operation in a potentially dangerous atmosphere should be constructed with a relatively low electrical resistance characteristic. It has become common practice to specify and refer to such belts as “static conductive,” “static dissipating,” or “anti-static.”

The accumulation of electro-static charges can be dangerous for different reasons:

- Generation of radio interference that can cause disturbance to electrical apparatus
- Risk of ignition and explosion in an atmosphere with high levels of combustible materials
- Risk of injury to workers in contact with the components

### V-Belt Drives

Timken belts that are static conductive are shown on the chart. Timken belts are branded as “static dissipating” when they meet or exceed testing developed by the Association for Rubber Products Manufacturers (ARPM Bulletin IP3-3).

### Synchronous Belt Drives

Timken synchronous belts are not static dissipating.
